# Reactivity Swing

“A well-designed core is one that has the absolute minimum reactivity swing,” [1] as surplus implies that neutrons that could have otherwise contributed to fission and conversion are lost through external absorption and leakage.

[1] R. G. Cochran and N. Tsoulfanidis, "In-Core Fuel Management," in *The Nuclear Fuel Cycle: Analysis and Management*, La Grange Park, Illinois, American Nuclear Society, 1999, pp. 165-205.

**Figure 1.** A graphical depiction of the concept of reactivity swing.

# The Effect of Salt Volume Fraction

**Figure 2.** The Infinite multiplication factor,  $k_{\infty}$  as a function of salt volume fraction and  $^{235}\text{U}$  enrichment for a representative TAP pin cell.

**Figure 3.** Conversion ratio as a function of salt volume fraction and  $^{235}\text{U}$  enrichment for a representative TAP pin cell.

# A New Take on Control Rods

## Adaptive Reactivity Control

- Short Term
  - Moveable moderator rods
    - Similar to control rods in an LWR
- Long Term
  - Insert more moderated assemblies
    - Similar time interval to refueling and maintenance in an LWR

**Figure 4.** A conceptual depiction of a reactor vessel design that uses moveable or additional moderator rods for reactivity control.

# Simulating Operation

**Figure 5.** A visualization of the change in salt volume fraction as a function of burnup for the representative TAP operational scheme simulated in SERPENT 2.

## Overview

- Software
  - Serpent 2
- Fuel Cycle
  - 5% Enriched  $^{235}\text{U}$  Initial load & feed
- Modeling Considerations
  - Performed at the “assembly” level (5 by 5 rod array)
  - Fission product removal & fuel addition
  - Rod insertion

# Results: Spectrum

## Beginning of life (BOL)

- A high initial fissile load (5%) can achieve criticality on the hardened spectrum

## End of life (EOL)

- More thermal neutrons allow for low levels of enrichment to remain critical

**Figure 6.** The development of the neutron spectrum with increasing burnup, with BOL and EOL signifying the spectrums at the beginning and end of life respectively

# Results: Conversion Ratio

**Figure 7.** Conversion ratio as a function of a burnup for the representative TAP operational scheme simulated in SERPENT 2.

## Beginning of Life (BOL)

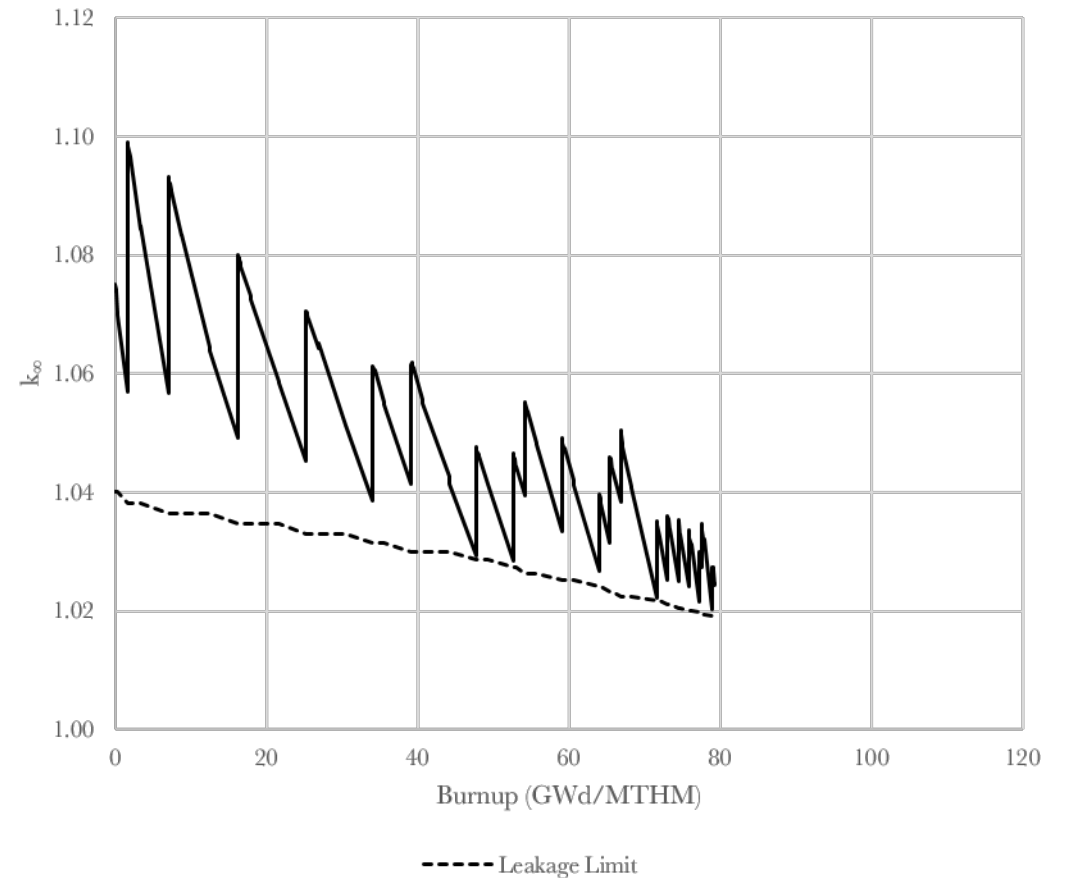

- Hardened spectrum allows for significant conversion of fertile material

## End of Life (EOL)

- Softening of the spectrum keeps the system critical, but plays a detrimental role in the progression of conversion ratio.

# Results: Criticality

- Bulk rod insertion
  - A rod addition in the model represents rod insertion in every assembly in the core
  - Not modeling short term control
- Leakage limit reduction coincides with the spectrum evolution

**Figure 8.** The infinite multiplication factor as a function of burnup for the representative TAP operational scheme simulated in SERPENT 2.

# Waste vs Burnup

**Figure 9.** Actinide waste production rate as a function of burnup. Please note the rates are normalized to a thermal power level of 2.27 GWth.

## • Fundamental Equations\*

- $\dot{W}_P = \frac{m_F}{CL}$

- $Bu = \frac{P \cdot CL}{m_T}$

- $m_C = \frac{P \cdot CL \cdot \bar{M}}{\bar{E}_F \cdot N_A}$

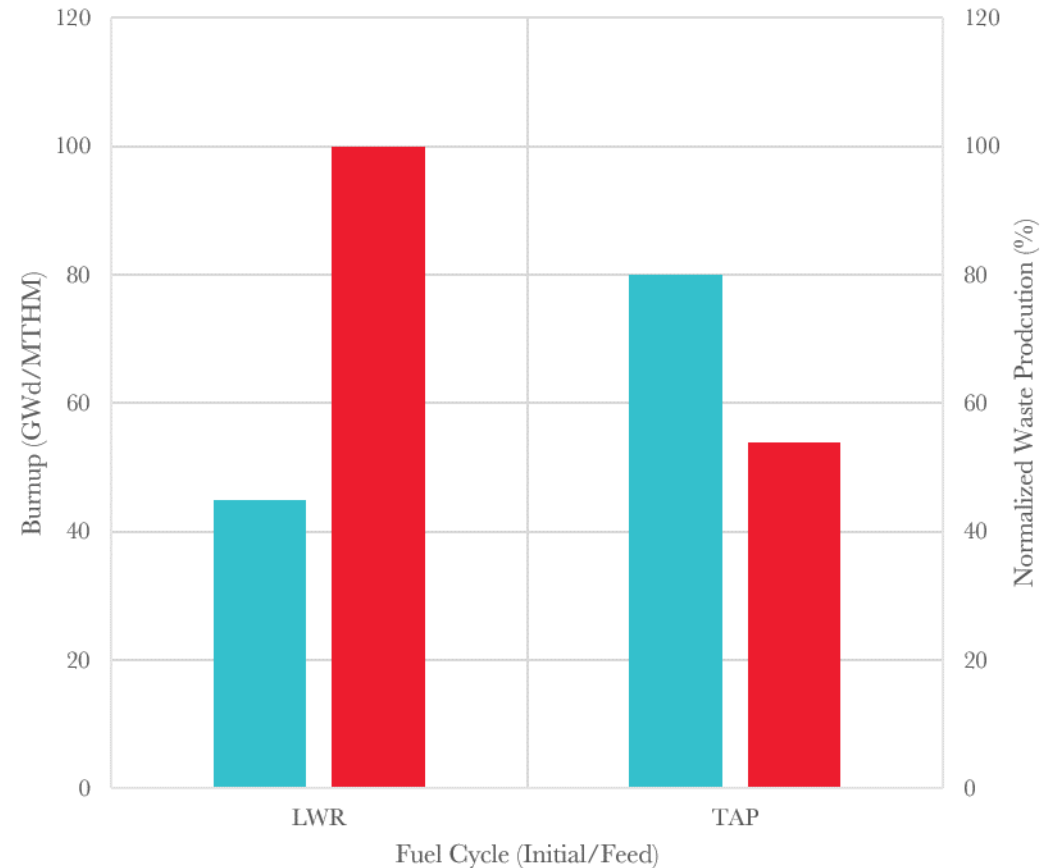

## • Derived Formulation\*

- $\dot{W}_P = \frac{P}{Bu} - \frac{P \cdot \bar{M}}{\bar{E}_F \cdot N_A}$

\*  $\dot{W}_P$  = Waste production rate,  $m_F$  = Remaining mass at the end of cycle,  $m_T$  = Total actinide mass used over the course of cycle,  $m_C$  = mass consumed over the course of cycle,  $\bar{M}$  = Average molar mass of fissioning nuclei,  $\bar{E}_F$  = Average energy per fission,  $N_A$  = Avogadro's number

# Summary

- Novel method of adaptive reactivity control
  - Moveable moderator rods
- Increased performance even without modeling short term control
  - Conventional 5% fuel cycle
  - Burnup > 80 GWd/MTHM
  - 50% Waste reduction compared to current LWR's

**Figure 10.** A comparison of the burnup (blue) and waste production (red) of an LWR and the TAP MSR, operating on the conventional 5% fuel cycle.

# Questions?

*Transatomic Power Corporation*

October 5<sup>th</sup>, 2016

# Additional: Parameters

- Neutron Population
  - 300 active cycles
  - 100 inactive cycles
  - 10000 neutrons per cycle
- Cross Section Data
  - ENDF-VII.1, 900 K
- Depletion Time Step\*
  - $\Delta t = \Delta t_I \cdot 5^{n-1}$
  - $\Delta t_I = 0.1 \text{ days}$
  - $\Delta t_{Max} = 182.5 \text{ days}$

- Boundary Conditions

- Reflective

- Conversion Ratio\*

$$CR = \frac{(^{238}\text{U} + ^{240}\text{Pu})(n, \gamma)}{(^{235}\text{U} + ^{239}\text{Pu} + ^{241}\text{Pu})(n, \gamma + n, f)}$$

\*  $\Delta t$  = Time Step,  $\Delta t_I$  = Initial Time Step,  $\Delta t_{Max}$  = Maximum Time Step Size  $n$  = Step Number,  $(n, \gamma)$  = Radiative Capture,  $(n, f)$  = Fission

# Additional: Isotopic Evolution

- Decreased conversion over the course of life cause the slope of the total fissile evolution to increase with time.
- Significant reduction in  $^{238}\text{U}$  capture at the EOL compared to BOL leads to the sharp drop in  $^{239}\text{Pu}$ .

**Figure 11.** Illustrating the effect of conversion ratio, the above data shows the development of the primary fissile isotopes with increasing burnup.

# Additional: Convergence

**Figure 12.**  $k_{\infty}$  as a function of the number of active cycles simulated

**Figure 13.** Shannon entropy as a function of the number of inactive cycles simulated

# Additional: Literature

**Table 1.5** Effective energy released per thermal fission for the three primary fissile isotopes

Isotope	Thermal Fission Energy Release (MeV)
$^{235}\text{U}$	192.9
$^{239}\text{Pu}$	198.5
$^{241}\text{Pu}$	200.3

**Table 1.6** Average neutrons released per thermal fission for the three primary fissile isotopes

Isotope	Neutrons Released per Thermal Fission
$^{235}\text{U}$	2.42
$^{239}\text{Pu}$	2.87
$^{241}\text{Pu}$	2.93

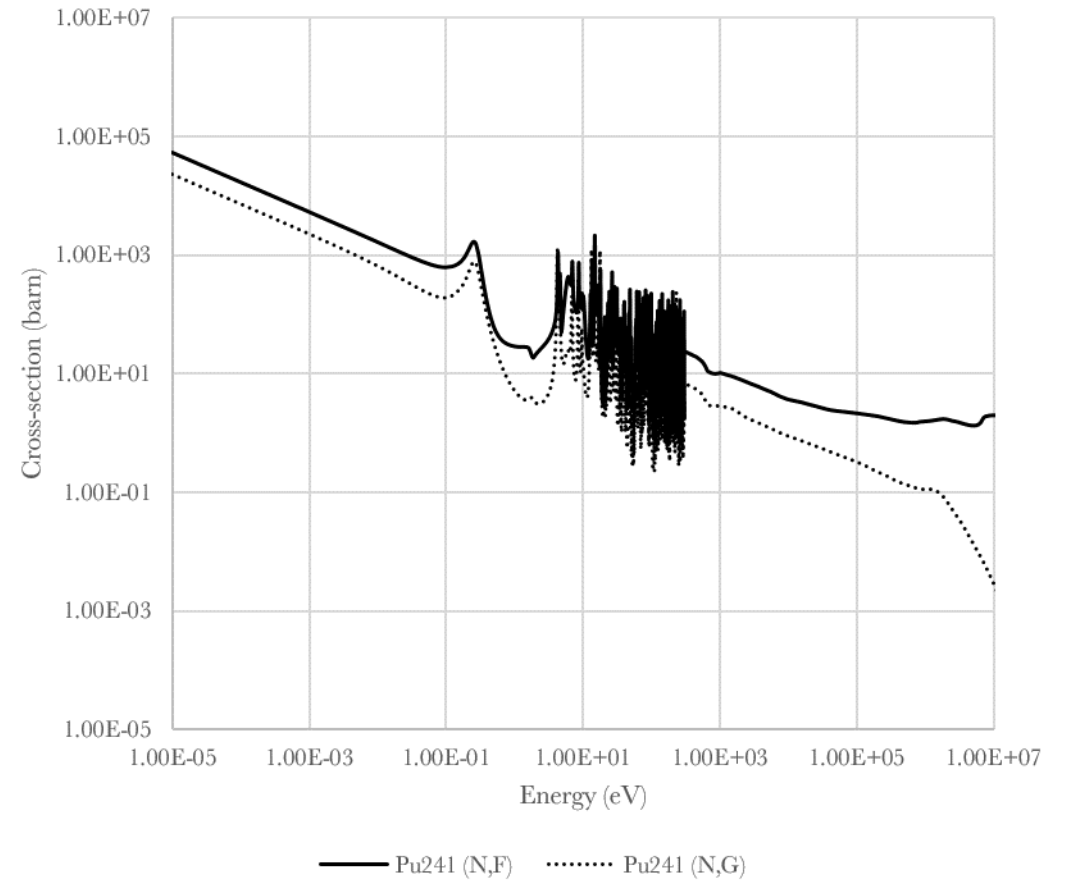

**Figure 14.** Fission and capture cross-sections for  $^{235}\text{U}$ , data taken from ENDF-VII.1

# Additional: Literature

**Figure 15.** Fission and capture cross-sections for  $^{239}\text{Pu}$ , data taken from ENDF-VII.1

**Figure 16.** Fission and capture cross-sections for  $^{241}\text{Pu}$ , data taken from ENDF-VII.1
