

CASL: Consortium for the Advanced Simulation of Light Water Reactors

A DOE Energy Innovation Hub

Lesson's Learned for Molten Salt Reactor Development

Dr. Jess C. Gehin
CASL Director

2016 Molten Salt Reactor Workshop
Oak Ridge National Laboratory

October 5, 2016

Innovation – Learning from Bell Labs

- Per Jon Gertner: *“Innovation defined the lengthy and wholesale transformation of an idea into a technological product (or process) meant for wide spread practical use.”*
- This cannot be performed by a single group.
Needs:
 - Discovery
 - Turning discovery into invention
 - Turning invention into a product
 - Implementing the product
- Hence, a connection from scientists, engineers, product development, and deployment
- Bell Labs did this all within their own company
 - Discovery, research, engineering, and product use under “one roof”

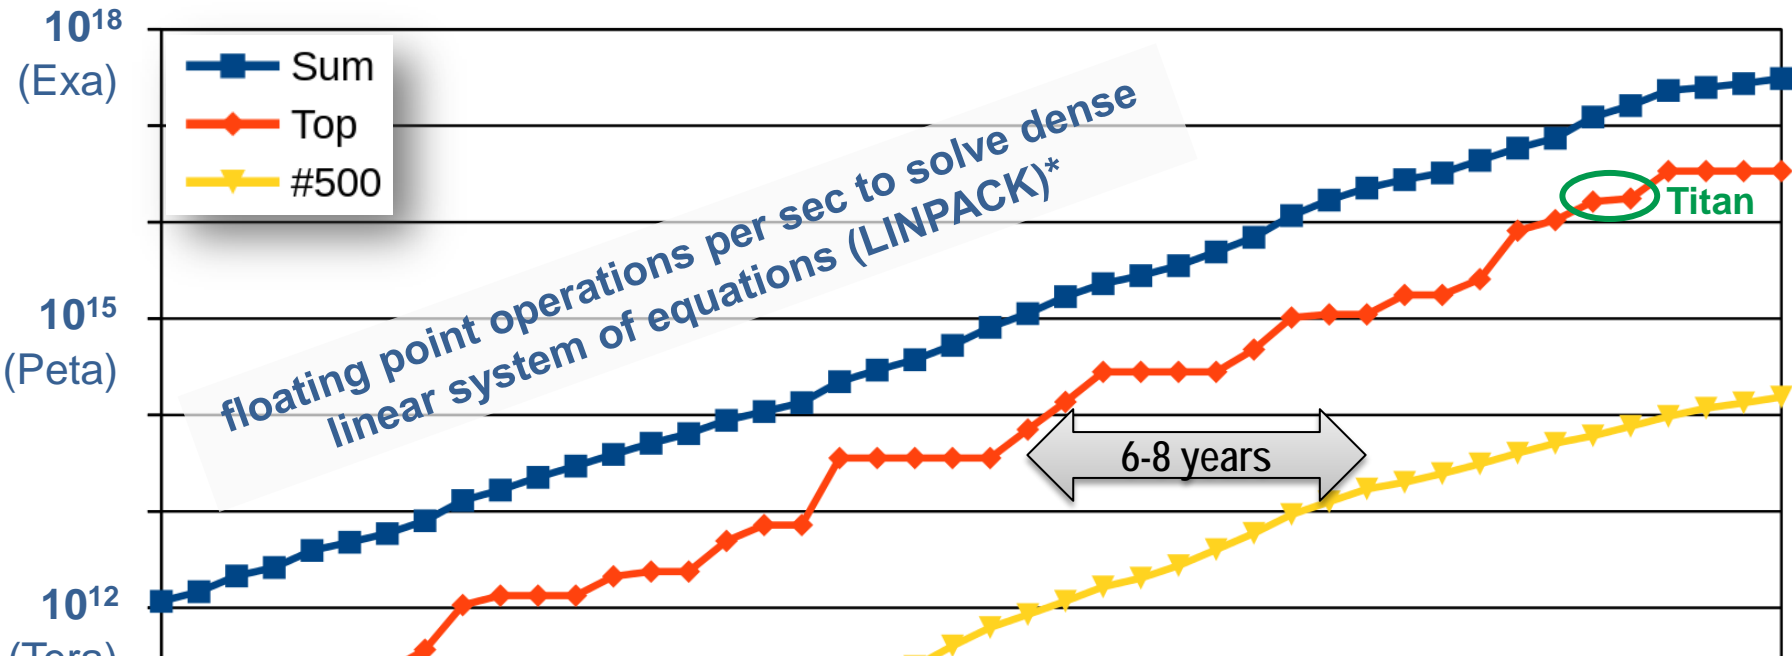

What is a DOE Energy Innovation Hub?

- Target problems in areas presenting the most critical barriers to achieving national climate and energy goals
- Represent a new structure, modeled after research entities like the Manhattan Project and AT&T Bell Labs
- Focus on a single topic, with work spanning the gamut, from basic research through engineering development to partnering with industry in commercialization
- Large, highly integrated and collaborative creative teams working to solve priority technology challenges
 - Bring together the top talent across the R&D enterprise (gov, academia, industry, non-profits) to become a world-leading R&D center in its topical area

Advanced modeling and simulation based on rapid growth in computing is tool for nuclear innovation

<http://en.wikipedia.org/wiki/TOP500>

Attributes Sought by DOE for the Energy Innovation Hub for Modeling & Simulation of Nuclear Reactors

- **Utilize existing** advanced modeling and simulation capabilities developed in other programs within DOE and other agencies
- **Apply them** through a new multi-physics environment **and develop capabilities *as appropriate***
- **Adapt the new tools** into the current and future culture of nuclear engineers and produce a multi-physics environment to be used by a wide range of practitioners **to conduct predictive simulations**
- Have a **clear mission that focuses and drives R&D**
- Use **data from real physical operation reactors to validate** the virtual reactor
- Lead organization with **strong scientific leadership** and a clearly defined central location (“one roof” plan)

Nuclear Energy Drivers and Payoffs for M&S technology

- **Extend licenses of existing fleet (to 60 years and beyond)**
 - Understand material degradation to reduce inspection & replacements
- **Up-rate power of existing fleet**
 - Address power-limiting operational & design basis accident scenarios
- **Inform flexible nuclear power plant operations**
 - Load follow maneuvering & coolant chemistry to enhance reliability
- **Design and deploy accident tolerant fuel (integrity of cladding)**
 - Concept refinement, test planning, assessment of safety margins
- **Margin quantification, recovery, tradeoff**
 - Plant parameters, fuel hardware, reload flexibility, regulatory changes
- **Resolve advanced reactor design & regulatory challenges**
 - Support Gen III+ reactors under construction (AP1000), refine SMR design
- **Fuel cycle cost savings**
 - More economical core loadings and fuel designs
- **Used fuel disposition**
 - Inform spent fuel pools, interim storage, and repository decisions

The Consortium for the Advanced Simulation of Light Water Reactors - An Energy Innovation Hub

- Established by Former DOE Energy Secretary Steven Chu
- Modeled after the scientific management characteristics of AT&T Bell Labs:
 - Addressing critical problems
 - Combines basic and applied research with engineering
 - Integrated team to take discovery to application
- 10 year focused R&D effort (2010– 2019)

“Multi-disciplinary, highly collaborative teams ideally working under one roof to solve priority technology challenges”

– Steven Chu

CASL MISSION

Provide leading-edge modeling and simulation (M&S) capabilities to improve the performance of currently operating and future light water reactors (LWR's)

CASL is a National Laboratory, Industry, University Partnership

International Collaborators

CASL Contributing Partners

CASL Contributing Partners

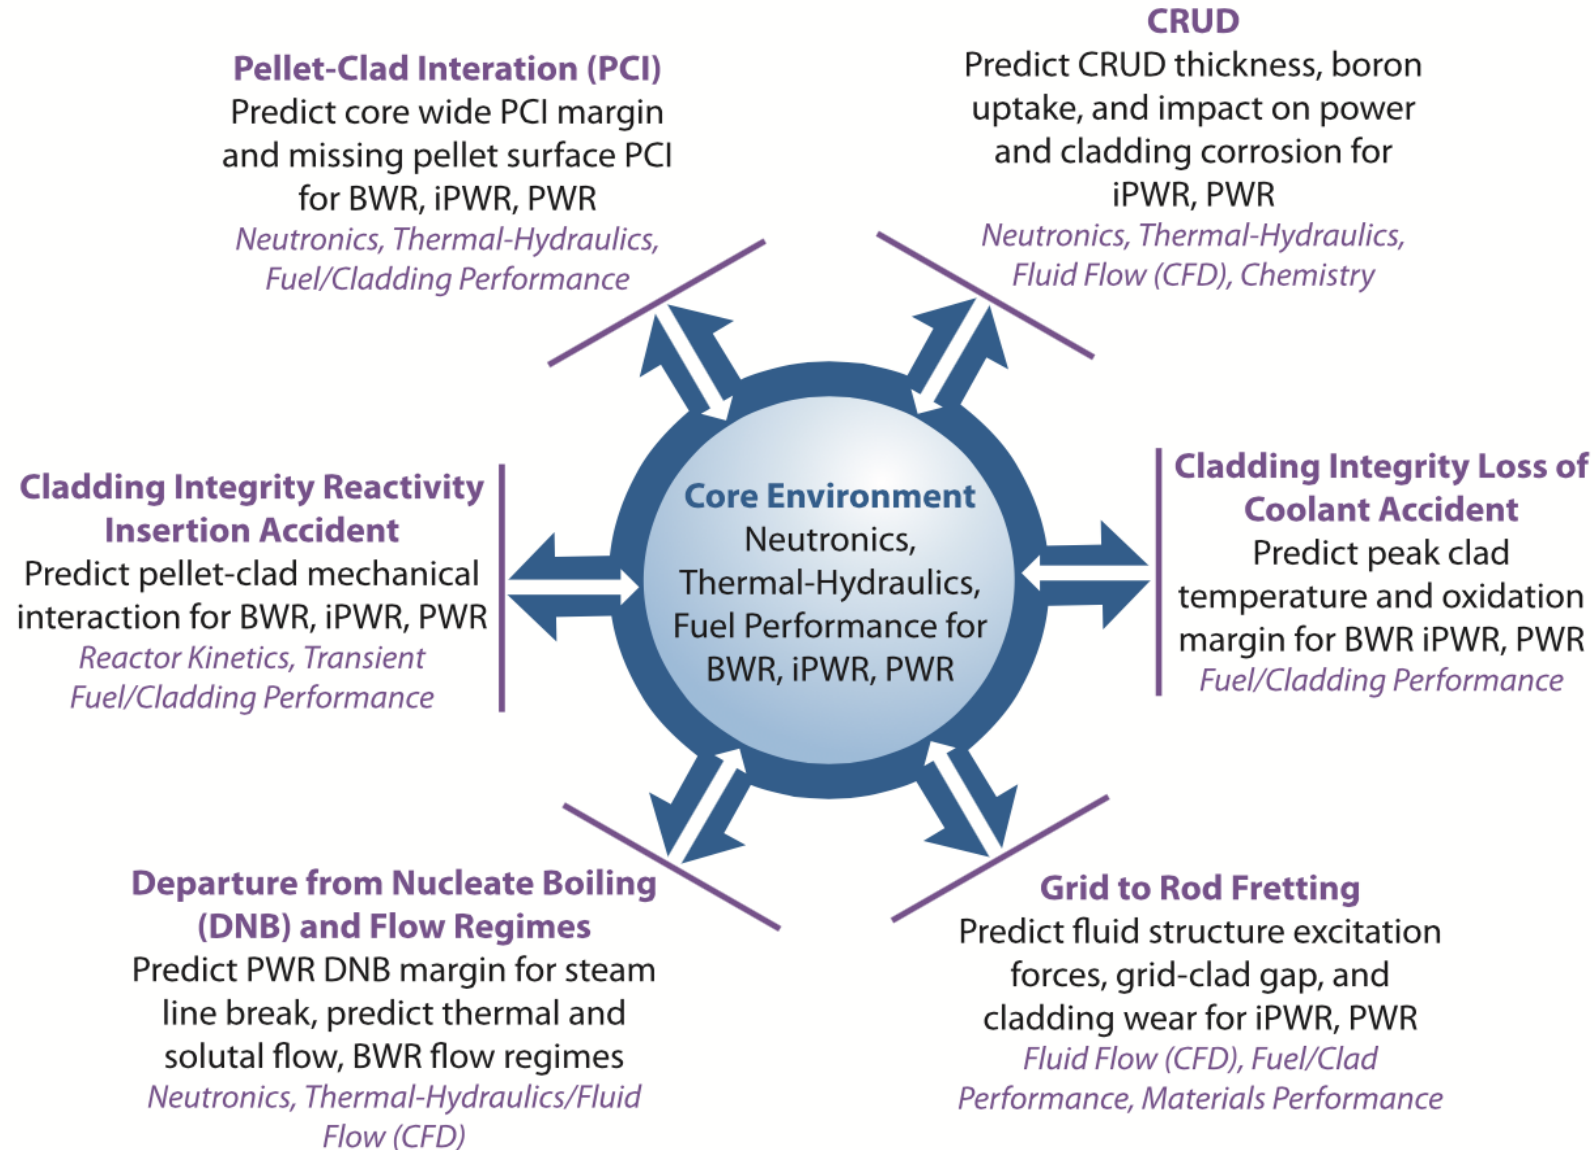

CASL Scope: Develop and apply a “Virtual Reactor” to assess fuel design, operation, and safety criteria

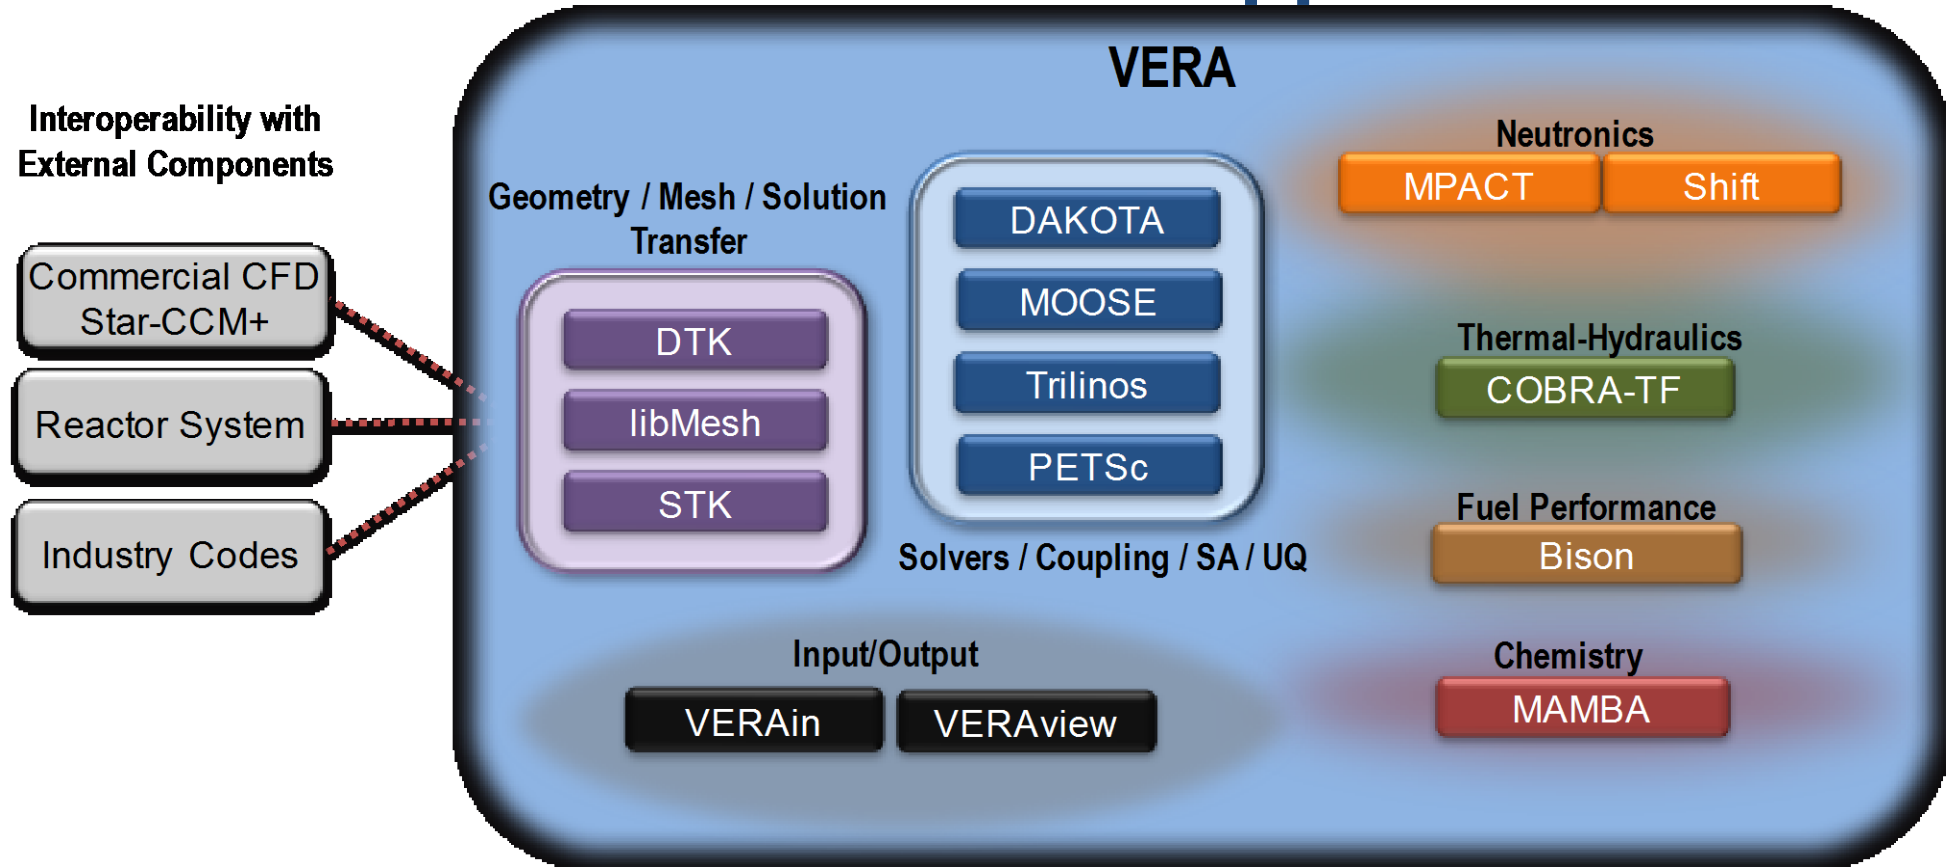

- Deliver improved predictive simulation of Light Water Reactors
 - Focus on fuels, vessel, internals
 - First five year focus on PWRs, broadened to BWR and Light Water Small Modular Reactors
- Equip the Virtual Reactor with necessary physical models and multiphysics integration
 - Build the Virtual Reactor with a comprehensive, usable, and extensible software system
 - Validate and assess the Virtual Reactor models with self-consistent quantified uncertainties
- Apply the virtual reactor to address challenges in reactor operations

Our Challenge Problems are Focused on Key Commercial Reactor Performance Areas

Virtual Environment for Reactor Applications

- Physics components for reactor simulation and challenge problems
- Same or better spatial scales as current methods
- Direct multi-physics couplings between physics
- High attention to usability and parallel performance

CASL Tools Applied to Operating Plants - Watts Bar Nuclear Unit 1 Operation

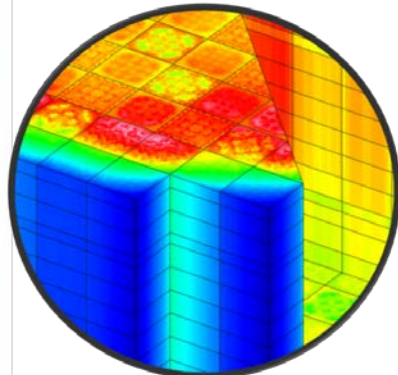

- Operated by Tennessee Valley Authority
Traditional four-loop Westinghouse PWR
- Began operation in 1996
- Currently in 14th fuel cycle
- 3459 MW_{th} thermal power
- Unit 2 Critical on May 23, 2016

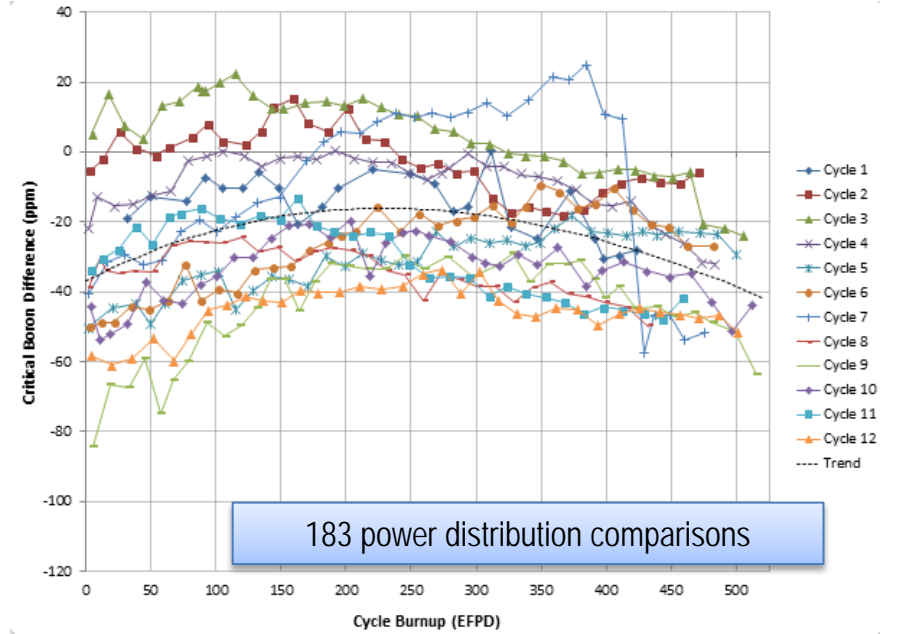

VERA Results: Watts Bar Unit 1

CASL Challenge Problem: Watts Bar 1 Cycle 7 Predicted Crud Distribution

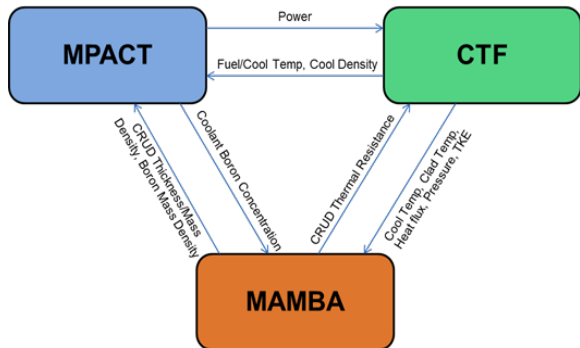

Crud Distribution

Boron Distribution

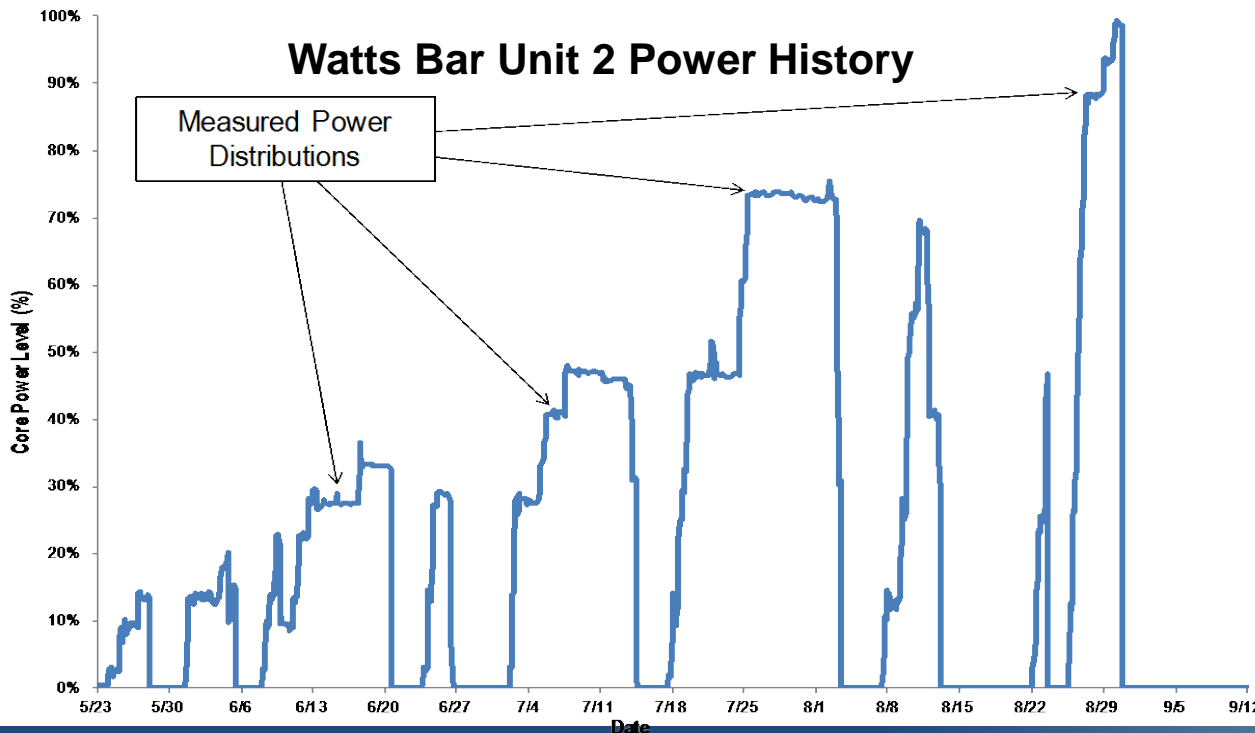

The Result is a Significant Improvement in Power Distribution

CASL is Modeling Watts Bar Unit 2 Startup and Power Ascension

- Watts Bar Unit 2 initial criticality was on May 23, 2016
 - Dec. 2015 – Fuel Load
 - May 23, 2016 – Initial criticality
 - June 3, 2016 – On the power grid
 - June – August, 2016 – Power Ascension Testing
 - August 30, 2016 – Reactor trip from 99% power (transformer fire)
 - October, 2016 – Full power operation
- VERA results have already been important for informing Westinghouse and TVA evaluations

Industry Highlights CASL's Impact and Potential

"VERA is a game-changing technology .. I expect that we will look back and say, 'Wow, that technology really changed how we predict what is happening in a reactor.'" - Heather Feldman, a Program Manager in EPRI's Nuclear sector.

WESTINGHOUSE RECOGNIZED AS TECHNOLOGY LEADER AND RECEIVES INNOVATION AWARD
Posted November 24, 2014 by Cindy Pezze

Innovation is the primary foundation of the work we do at Westinghouse on nuclear products and services. It's my pleasure to congratulate Westinghouse and our partners from Oak Ridge National Laboratory (ORNL) in the Consortium for Advanced Simulation of Light Water Reactors (CASL) for being awarded the high-performance computing (HPC) Innovation Excellence Award.

Westinghouse was among seven companies recognized with this noteworthy honor earlier this year at the International Supercomputing Conference in Leipzig, Germany.

The Westinghouse team received the award for successfully performing core physics simulations of the company's AP1000® reactor using the CASL Virtual Environment for Reactor Applications (VERA). The calculations, performed on 240,000 computer cores on the Titan Cray XK7 system at the Oak Ridge National Laboratory, simulated with extraordinary fidelity the in-reactor conditions and phenomena to occur during the AP1000 reactor core startup.

This project is significant for several reasons. First and foremost, it leveraged some of the best talent and tools here at Westinghouse, and allowed us the opportunity to work with an outstanding group of scientists from across the country.

The CASL project is an impressive investment in innovation for Westinghouse and the entire team. The AP1000 plant computer simulations through this project were previously beyond reach. They now have been made possible, thanks to applying advanced simulation techniques that make best use of HPC infrastructures to

Members of the Westinghouse-CASL team proudly display their award (from L to R): Jess Gehin, Oak Ridge National Laboratory; Fausto Franceschini, Westinghouse Electric Company; Andrew Godfrey, Oak Ridge National Laboratory; and John Turner, Oak Ridge National Laboratory.

What Goes On Inside a Reactor Core? DOE Supercomputer Can Tell You

- Titan supercomputer accurately simulates reactor core physics, from Watts Bar 1 to AP1000s
- Electric customers could benefit from longer operating runs, reduced fuel costs
- DDE-NuScale joint program will model small reactor operation, inform design decisions

By Thaddeus Swanek

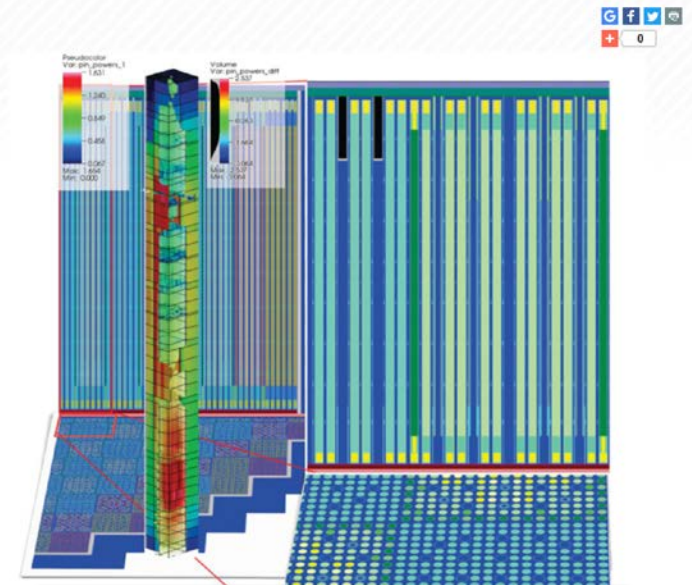

Jan. 7, 2016—At first, supercomputing and nuclear energy would seem an odd couple. Nuclear power is an analog technology rooted in the 1940s, while supercomputing is a product of revolutions in microprocessors and computing technologies that began in the 1970s. But today, one of the world's fastest supercomputers is simulating the complex systems inside nuclear reactor cores, simulations that should help make nuclear power plants more efficient.

The Titan supercomputer at Oak Ridge National Laboratory in Tennessee. [Photo: CASL].

Simulation of AP1000 first core with VERA

CASL technology deployed at the industry proves beneficial for challenging simulation scenarios

Key Points Leading to CASL's Success

- ✓ **Built an exceptionally strong and talented team**
- ✓ **Clear deliverables that solve industry issues and are driven by a well-defined yet agile plan**
- ✓ **A true private-public partnership in management, leadership, and execution leveraging the strengths of each type of organization**
- ✓ **Defined customers and users, with “industry pull” ensured by industry partners and industry council**
- ✓ **Led by one institution with resource allocation authority and responsibility**
 - ◆ DOE empowers lead institution and Hub leadership (“light federal touch”) as long as execution and performance warrants
- ✓ **BOD providing oversight and advice on management, plan, and science & technology (S&T) strategy**
- ✓ **Independent councils to review and advise on quality and relevance of S&T**
